

Epidemic Dynamics of Sudden Oak Death in the Forests of Oregon

Adam Carson

Introduction

P. ramorum background:

- Oomycete pathogen (water mold)
- Causal agent of Sudden Oak Death (SOD)
- Exotic introduction to the U.S. mid 1990's
 - Wide distribution in California
 - In Oregon, range is restricted to Curry County
 - 42.8 million disease-killed trees in CA & OR by 2019
- (Cobb, Richard C., et al. 2020)
- Four clonal lineages:
 - NA1, NA2, EU1, EU2
- Generalist pathogen:
 - Can infect over 130 species of plants
 - In Oregon primary host is tanoak

Introduction

Introduction

Materials & Methods

Isolate Selection:

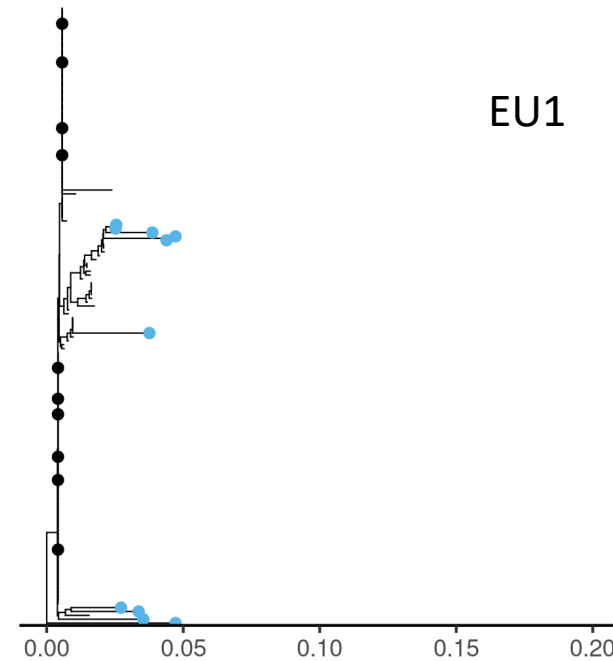

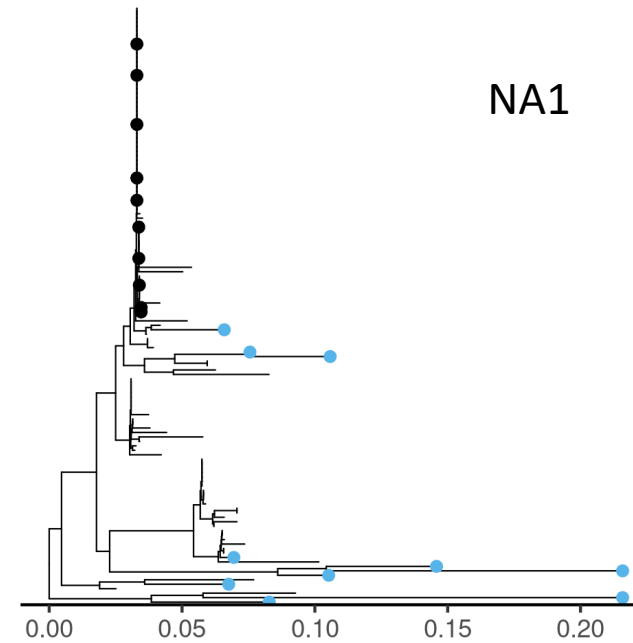

- Isolates collected by Oregon Department of Forestry from the NA1 & EU1 epidemic area in Curry County
- Isolates collected by Oregon Department of Forestry from the NA1 & EU1 epidemic area in Curry County
- NA1 collected 2001-2005
- EU1 collected 2015-2019
- Lineages geographically separated

Materials & Methods

Isolate Selection:

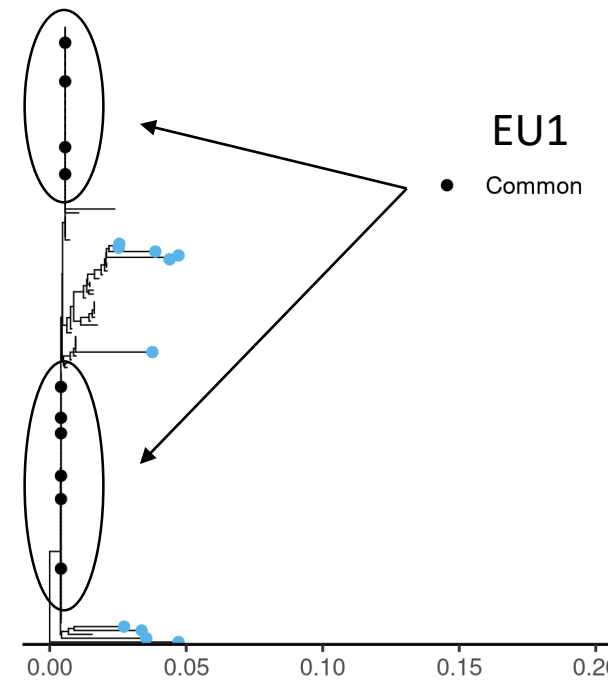

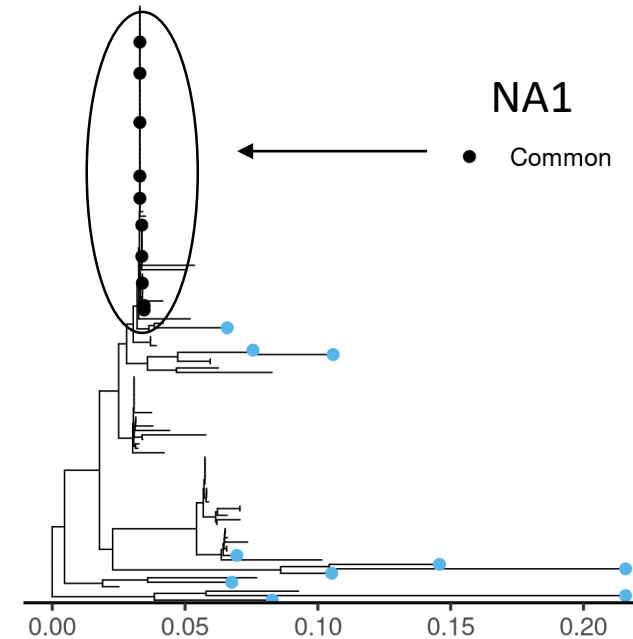

- 300 fully-sequenced isolates (EU1 & NA1) from the first five years of the Oregon SOD outbreaks
- SNP data used to generate BUSCO neighbor joining trees for each lineage

Materials & Methods

Isolate Selection:

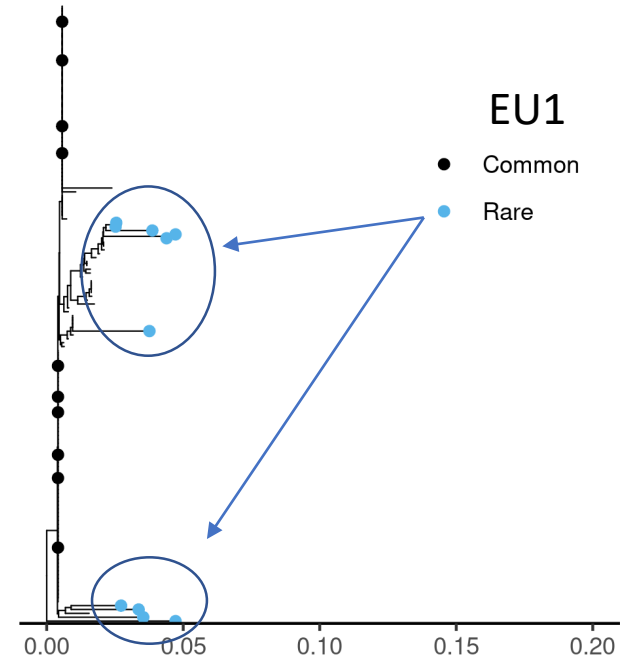

- 300 fully-sequenced isolates (EU1 & NA1) from the first five years of the Oregon SOD outbreaks
- SNP data used to generate BUSCO neighbor joining trees for each lineage
- Highly represented clades considered ‘common’ (abundant)

Materials & Methods

Isolate Selection:

- 300 fully-sequenced isolates (EU1 & NA1) from the first five years of the Oregon SOD outbreaks
- SNP data used to generate BUSCO neighbor joining trees for each lineage
- Highly represented clades considered 'common' (abundant)
- Less represented clades considered 'rare' (less-abundant)

Materials & Methods

Isolate Selection:

- 300 fully-sequenced isolates (EU1 & NA1) from the first five years of the Oregon SOD outbreaks
- SNP data used to generate BUSCO neighbor joining trees for each lineage
- Highly represented clades considered ‘common’ (abundant)
- Less represented clades considered ‘rare’ (less-abundant)
- 40 isolates selected (10 common & 10 rare for each lineage)
- Common isolates selected randomly, rare isolates selected by greatest genetic distance

Materials & Methods

Isolate Growth Measurements:

- Plate isolates on artificial growth media
- Growth expansion tracked along 4 perpendicular radii
 - Edge of growth marked on day 2, day 5, day 8
- Measurements used to calculate:
 - Growth rate (mm/day)
 - Final area of growth (mm²)

Materials & Methods

Leaf Inoculations:

- Cultured isolates used to wound-inoculate tanoak leaves
- 2 week incubation at 6°C, 11°C, & 16°C

Materials & Methods

Leaf Inoculations:

- Cultured isolates used to wound-inoculate tanoak leaves
- 2 week incubation at 6°C, 11°C, & 16°C

Materials & Methods

Leaf Inoculations:

- Cultured isolates used to wound-inoculate tanoak leaves
- 2 week incubation at 6°C, 11°C, & 16°C
- Sporangia captured via vacuum filtration

Materials & Methods

Leaf Inoculations:

- Cultured isolates used to wound-inoculate tanoak leaves
- 2 week incubation at 6°C, 11°C, & 16°C
- Sporangia captured via vacuum filtration
- Sporangia counted along 2 diagonal transects

Materials & Methods

Leaf Inoculations:

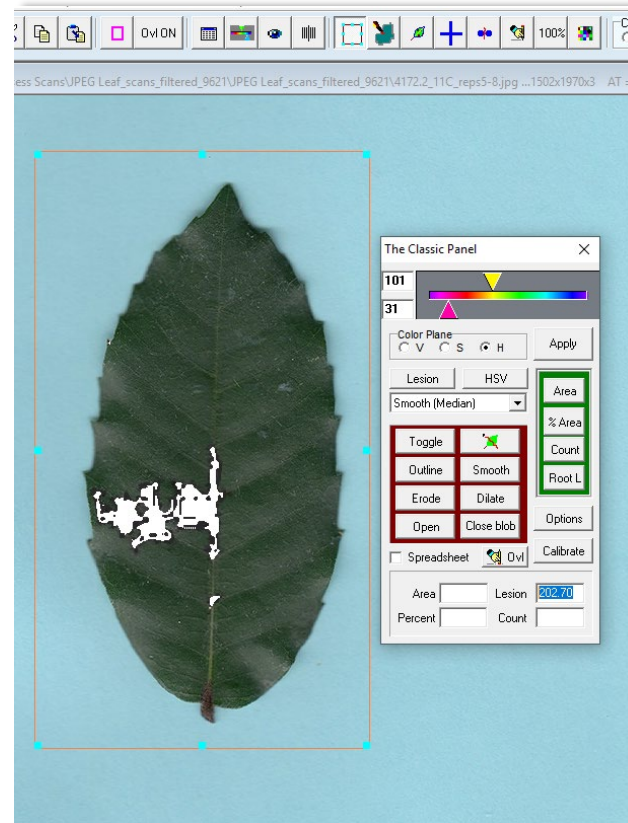

- Cultured isolates used to wound-inoculate tanoak leaves
- 2 week incubation at 6°C, 11°C, & 16°C
- Sporangia captured via vacuum filtration
- Sporangia counted along 2 diagonal transects

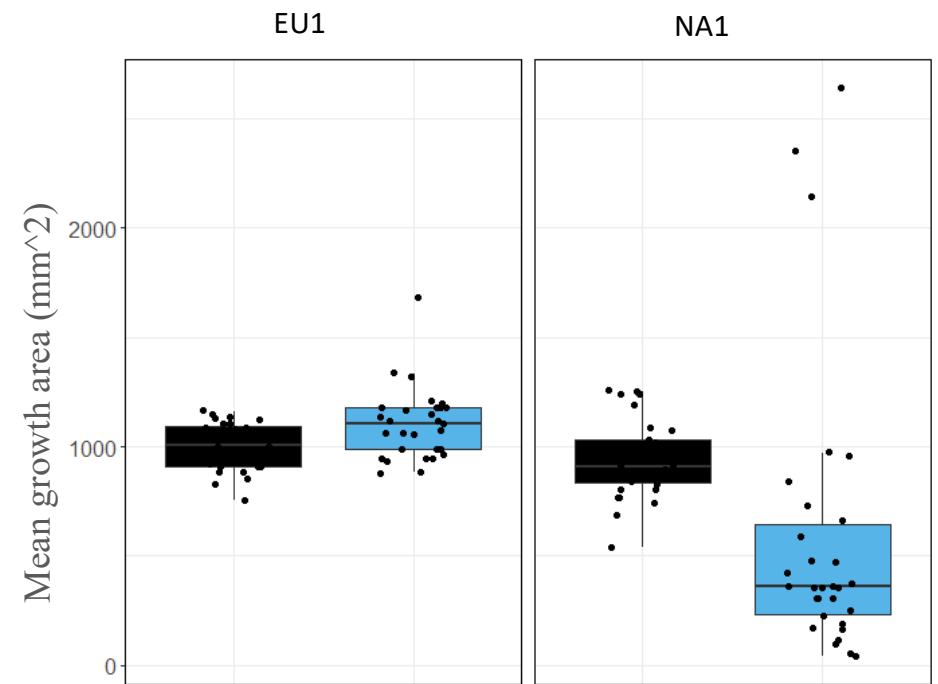

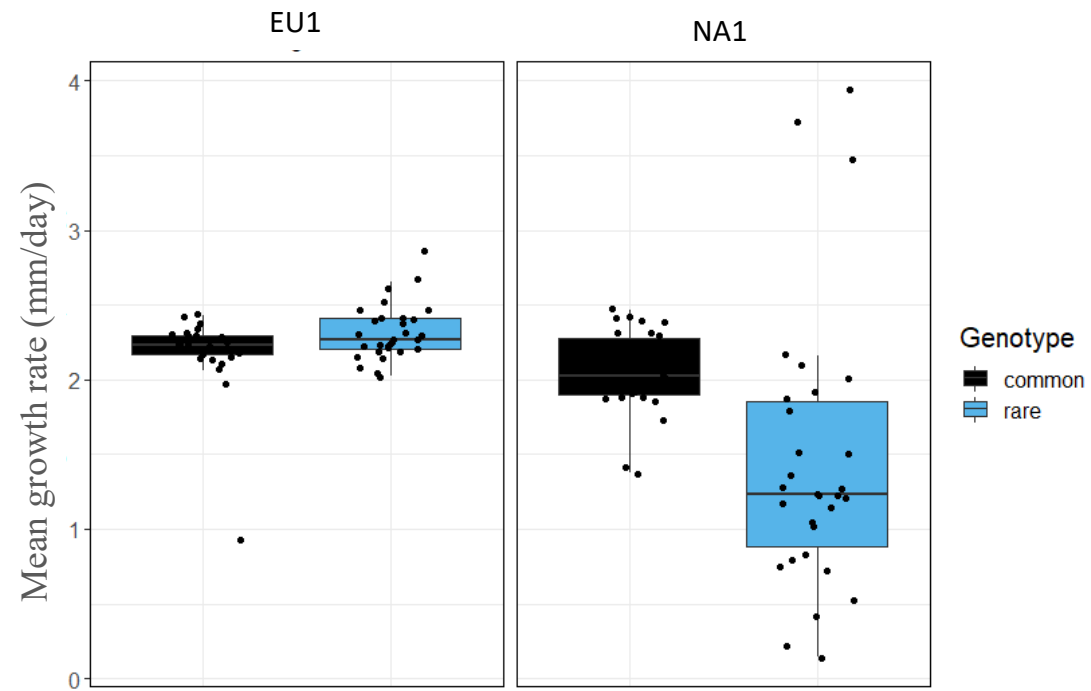

Materials & Methods

Lesion Measurements:

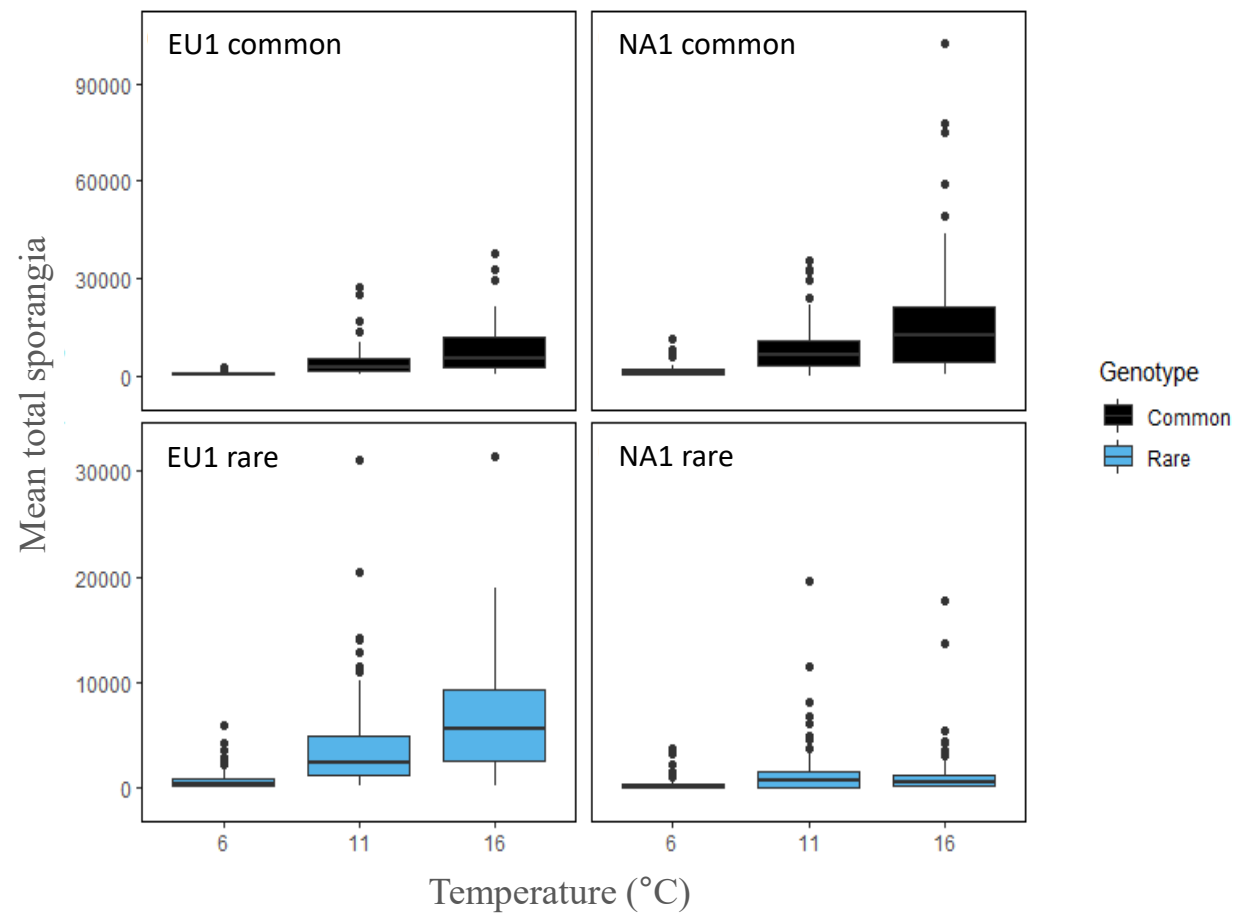

- Inoculated leaves scanned for lesion measuring, post sporangia capture
- Leaf & lesion area quantified using APS ASSESS 2.0 software
- Measurements used to calculate proportion of leaf-lesion area

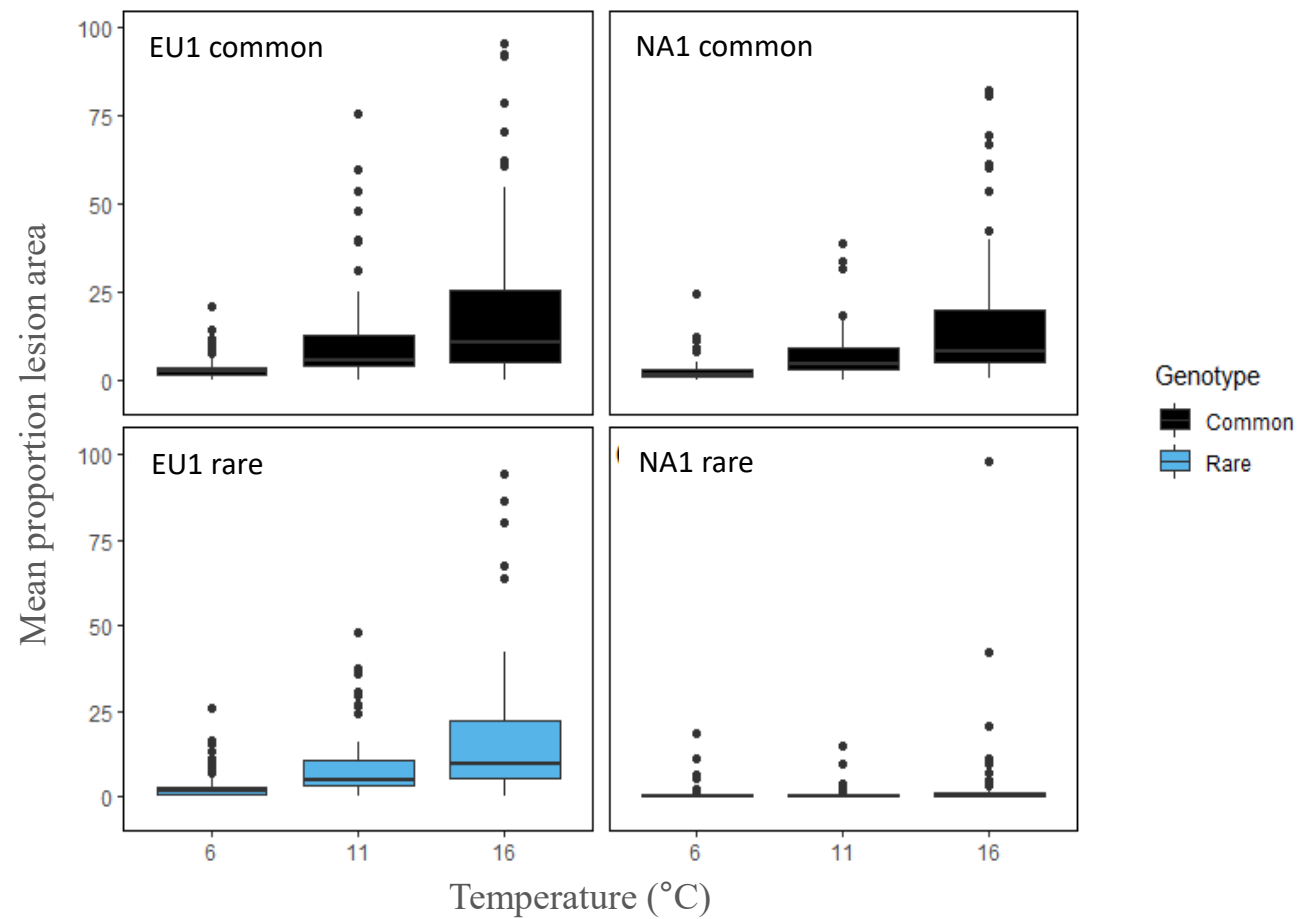

Results

Results

Results

Introduction

SOD Disease management:

- Local eradication of infected tanoak trees
- Aerial surveys for detection of infected trees

Introduction

SOD Disease management:

- Local eradication of infected tanoak trees
- Aerial surveys for detection of infected trees
- Treatment buffers established
- ‘Hack-and-squirt’ herbicide application of all tanoaks within the treatment boundaries

Introduction

SOD Disease management:

- Local eradication of infected tanoak trees
- Aerial surveys for detection of infected trees
- Treatment buffers established
- ‘Hack-and-squirt’ herbicide application of all tanoaks within the treatment boundaries
- Felling and burning of all tanoaks within treatment boundaries

Introduction

Table 2. Funding sources and total costs (in US\$) for management of the sudden oak death epidemic in southwestern Oregon forests^a

Year	USFS (Federal)	ODF (State)	BLM (Federal)	Landowners (Private)	Other agencies (State)	USDA APHIS/NRCS (Federal)	USFS ARRA (Federal)	Total program funding
2001	96,100	25,000	–	–	–	–	–	121,100
2002	258,400	50,000	–	–	–	–	–	308,400
2003	222,000	70,000	–	10,000	–	–	–	302,000
2004	404,700	70,000	–	10,000	–	–	–	484,700
2005	130,000	70,000	–	10,000	–	–	–	210,000
2006	424,000	436,000	–	10,000	–	70,000	–	940,000
2007	530,000	814,000	25,000	10,000	–	75,000	–	1,454,000
2008	838,000	252,000	445,000	10,000	–	325,000	–	1,870,000
2009	359,200	150,000	700,000	10,000	–	–	–	1,219,200
2010	569,000	95,000	531,000	10,000	–	–	2,692,000	3,897,000
2011	735,000	175,000	507,000	207,000	86,500	–	–	1,710,500
2012	805,000	260,000	447,000	–	–	–	–	1,512,000
2013	577,300	395,000	239,000	10,000	–	–	10,000	1,231,300
2014	640,000	290,000	557,000	10,000	10,000	–	–	1,507,000
2015	915,000	290,000	450,000	15,000	–	20,000	–	1,690,000
2016	842,000	490,000	467,000	10,000	–	20,000	–	1,829,000
2017	913,500	942,000	489,000	10,000	81,000	–	–	2,435,500
2018	1,188,997	1,215,000	328,784	10,000	334,687	–	–	3,077,468
2019	870,000	1,915,000	458,749	10,000	–	397,490	–	3,651,239
2020	1,138,000	365,000	737,000	10,000	15,774	116,711	–	2,382,485
2021	875,000	1,915,000	279,091	10,000	–	–	–	3,079,091
Total	13,331,197	10,284,000	6,660,624	382,000	527,961	1,024,201	2,702,000	34,911,983

^a USFS = United States Forest Service, ODF = Oregon Department of Forestry, BLM = Bureau of Land Management, Other agencies = Other Oregon state agencies, USDA = United States Department of Agriculture, APHIS = Animal and Plant Health Inspection Service, NRCS = Natural Resources Conservation Service, and ARRA = Americans for Responsible Recreational Access.

Introduction

Eradication effectiveness:

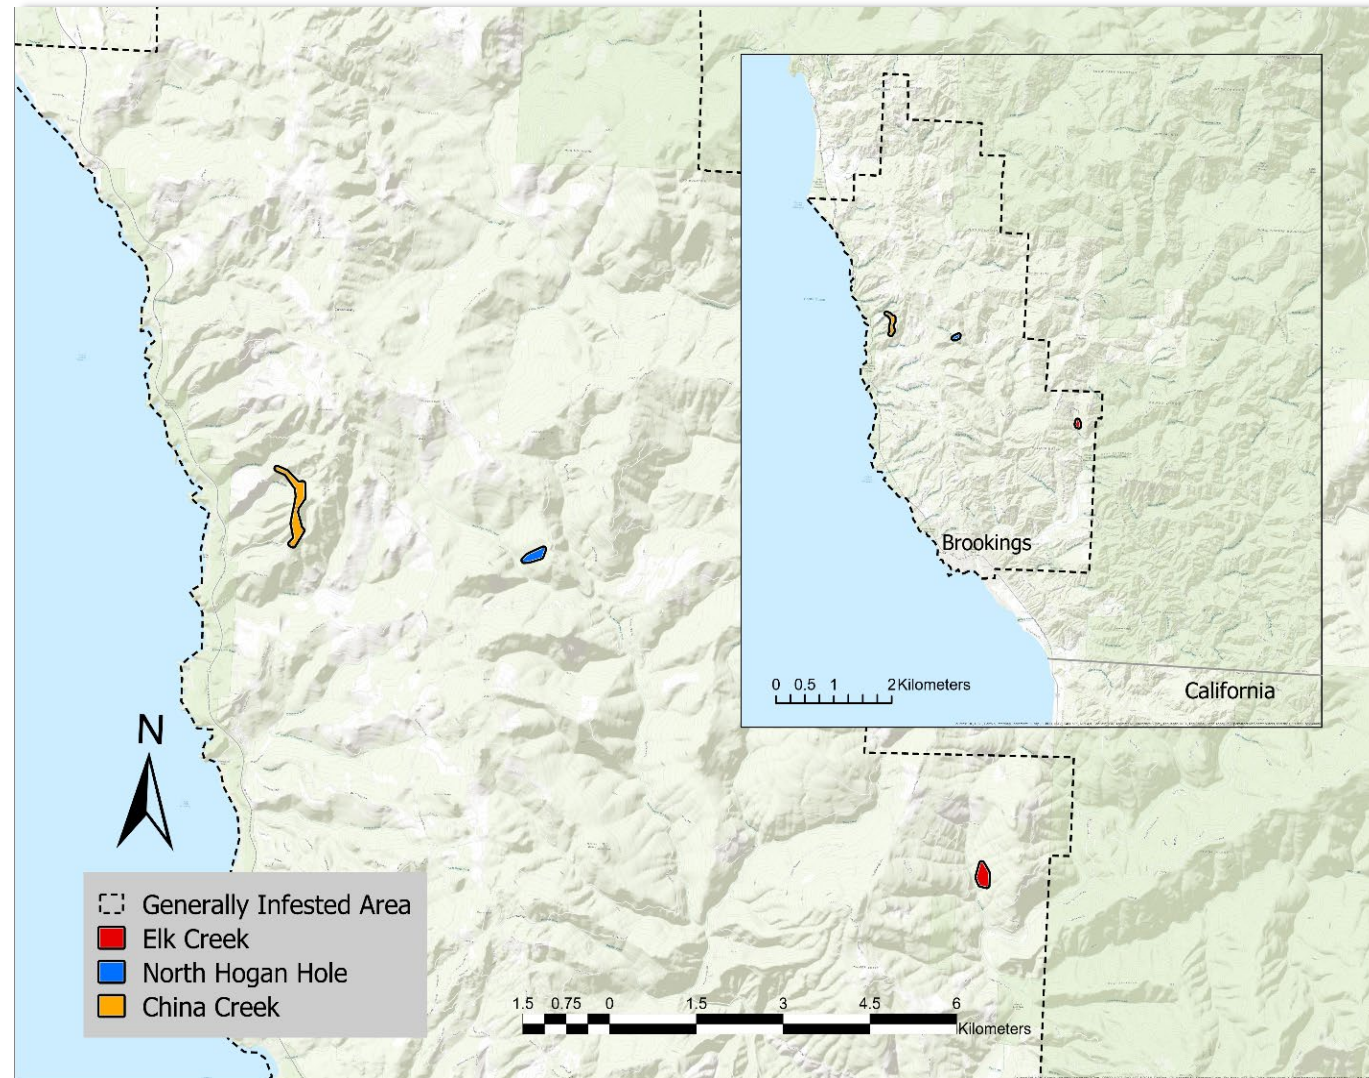

- ‘Hack-and-squirt’ plus felling and burning is effective at reducing infection prevalence (Hansen, 2008; Daniels, 2021)
- The effectiveness of ‘hack-and-squirt’ as a stand alone treatment is unknown

Epidemiology in Oregon:

- Reliance on regional weather data
- Microenvironmental differences unknown
- There is a need to further characterize local environmental optimums for sporulation and disease spread
